SUDHANSHU KUMAR

Bengaluru, Karnataka 560098 | +91 93043 72352 | sksingh032003@gmail.com
LinkedIn · GitHub · LeetCode

Final-year ECE student who spends most of his time shipping full-stack products end to end — React/Next.js on the front, Node and PostgreSQL underneath, and LLM features (RAG, agents, the OpenAI SDK) wired in only where they actually earn their place. I like owning a feature from the data model to the deployed UI and getting it in front of real users, not leaving it in a demo folder. Looking for a Full-Stack Developer role where I can keep building across the whole stack.

EDUCATION

JSS Academy of Technical Education, Bengaluru 2023 – 2027
B.E., Electronics & Communication Engineering — CGPA: 7.6 / 10
Class XII — 72% | Class X — 82%

TECHNICAL SKILLS

Languages: C++, JavaScript, TypeScript, Python, SQL

Full-Stack / Web: React, Next.js, Node.js, Express.js, PostgreSQL, MongoDB, Prisma, REST APIs, JWT Auth, Redis

AI / GenAI: OpenAI SDK, LangChain, LangGraph, RAG pipelines, prompt engineering, vector search (pgvector)

Tools & Platforms: Docker, Git/GitHub, FastAPI, Turborepo, BullMQ

Embedded (Coursework + hands-on): ESP32, biosensor integration (MAX30102 pulse-oximetry, AD8232 ECG, DS18B20, MPU6050), ADC sampling & sensor calibration, UART/SPI/I2C, interrupts, RTOS basics, digital electronics

PROJECTS

Context — Real-Time Incident Intelligence SaaS · MERN, OpenAI SDK, JWT Auth In progress

- Building a system that maps how services depend on each other and uses that graph to explain *why* an incident happened — and flag the ones likely to happen next — instead of leaving engineers to read raw stack traces.
- Wrote my own JWT auth layer (no third-party provider) on a MERN backend, and wired in the OpenAI SDK to turn raw graph and telemetry data into a plain-English root-cause explanation a human can act on.
- Shipping it in reviewed stages — auth, then the graph engine, then the incident feed — so bugs surface early instead of piling up at the end.

KRAMA OS — Personal Productivity SaaS · Turborepo, PostgreSQL/Prisma, Redis, BullMQ, pgvector GitHub ↗

- Built the backend on a Turborepo monorepo — PostgreSQL/Prisma for data, Redis + BullMQ to push anything that shouldn't block a request (reminders, digest emails) onto background workers.
- Put an AI Gateway in front of every LLM call that hashes and caches responses (SHA-256), so a repeated query never pays for a fresh API call twice — plus a pgvector RAG layer that grounds answers in the user's own data instead of guessing.
- Handled auth with JWT and rotating refresh tokens, then rebuilt the frontend from a plain dashboard into a HUD/control-room interface.

HealthGuard — IoT Health-Monitoring Dashboard · ESP32, FastAPI, MERN GitHub ↗

- Wired an ESP32 to a cluster of biosensors (MAX30102, AD8232, DS18B20, MPU6050), sampling and calibrating vitals on-device and streaming them over serial/I2C to a FastAPI/MERN backend.
- Built a React dashboard styled to feel like something a clinician would actually read — live and historical vitals, not a generic admin panel.

ACHIEVEMENTS

- Solved **150+** problems on LeetCode across Arrays, Linked Lists, DP, Recursion, and Hash Tables — and still going as placement season ramps up.
- Designed and stuck to my own 9–10 month roadmap covering full-stack development, GenAI, and DSA/interview prep, running it alongside coursework.
- Ship every project as a deployable, Dockerized service rather than a local demo — auth, background jobs, and data layer included.
