LinkedIn | GitHub | LeetCode

Final-year ECE student who builds full-stack projects, mostly in TypeScript. I've built a payment reconciliation tool, a productivity app and an incident dashboard, and used LLMs in two of them. Looking for a Full Stack Developer role.

Education

JSS Academy of Technical Education, Bengaluru 2023 – 2027
B.E., Electronics and Communication Engineering, CGPA: 7.5
Class XII: 72% | Class X: 82%

Technical Skills

- **Languages**: C++, JavaScript, TypeScript, Python, SQL
- **Frontend**: React, Next.js, Tailwind CSS
- **Backend & Databases**: Node.js, Express.js, NestJS, FastAPI, REST APIs, JWT Auth, Clerk, MongoDB, PostgreSQL, Prisma, Drizzle, Redis, BullMQ
- **AI / GenAI**: OpenAI SDK, LangChain, LangGraph, RAG, Prompt Engineering
- **Tools & Testing**: Docker, Git/GitHub, GitHub Actions, pnpm, Jest, Vitest, Supertest, Playwright

Projects

LedgerMind: AI Payment Reconciliation | GitHub *NestJS, Next.js, PostgreSQL/Prisma, Redis/BullMQ*

- Reconciles orders, payments, refunds, settlements and bank records. It matches by ID first, then bank reference (UTR), then amount and time, and ranks whatever is left by how much money is at risk.
- An AI assistant investigates each mismatch through 14 read-only tools and reports the likely cause, how confident it is, and the records behind it. It can only suggest a fix, and a person has to approve it.
- Webhooks are checked with HMAC and de-duplicated, and jobs run on BullMQ. Razorpay is mocked and the bank data is synthetic. Tests use Jest, Supertest and Playwright.

KRAMA: Personal Operating System | GitHub *React, TypeScript, Express, PostgreSQL/Prisma, Docker*

- A personal workspace I built solo: nested pages with a rich-text editor, full-text search and backlinks, plus a Kanban board with sprints and issue dependencies.
- Pages and issues connect through projects and goals. Progress rolls up on its own, and a pace check compares where a goal should be with where it actually is.
- Express API with JWT in httpOnly cookies. I checked each feature end to end against a real database.

Context: Incident Intelligence Platform | GitHub *React, TypeScript, Express, PostgreSQL/Drizzle, OpenAI SDK*

- Shows how services depend on each other as a graph. When one fails, it traces the cascade back to the likely cause and estimates how far the damage spreads and what it costs.
- An OpenAI-powered assistant explains the cause with a confidence score, written for an engineer, an SRE or a manager. It is read-only, and fixes are tried in a sandbox first.
- Multi-tenant API with Clerk auth. Vitest tests cover tenant isolation, token rotation and the audio stream buffer.

Health Monitoring System: IoT Dashboard *ESP32, FastAPI, MERN*

- Built an ESP32 node with biosensors that sends vitals to a FastAPI/MERN backend.
- React dashboard shows live and historical readings.

Achievements

- Participated in the Replit Buildathon and the Razorpay Buildathon.
- Solved 100+ problems on LeetCode.
